

PROJECT FACT SHEET

Maps that fit your site.

Mapsight is an open-source framework for communicative web maps designed to take on the host site's look. It is for teams integrating maps into their own websites.

■ Work in progress; used in controlled production deployments, not yet turnkey.

Scope and limits

For understandable thematic maps on websites. It does not replace a full geoportal or GIS back office. Planning and technical integration are required.

Sources and data flows

You choose basemap and data sources. Review requests, recipients, licences and operating terms for each source. Outcomes depend on your configuration.

Technical context

Mapsight Core and Mapsight UI belong to the frontend. Mapsight Pulp is an independently usable PHP companion library, not a required frontend dependency. Assess its use separately.

Licensing and operation

The public framework repository is MIT-licensed; independently published companions retain their own package terms. Marks and logos have separate terms. Assign responsibility for integration, updates and operation.

Developed in Germany.

Questions before procurement

■ Accessibility is a design goal; audit planned.

1. Who is the audience and what task should the map support?
2. Which data and basemaps are needed, and who checks their licences?
3. Which external requests does your configuration generate? Is a proxy needed?
4. Which keyboard, alternative-content and testing requirements must be accepted?
5. Who handles integration, hosting, maintenance and assessment of open findings?

Public sources to review

Project sources describe development status; they are not independent certification. Check the current version and your specific configuration.
